Note Adobe Photoshop CS2 and CS3 are "classic" versions of Photoshop. CS4 and CS5 are the current releases. ## Where to Get Photoshop Adobe Photoshop is available in all the major computer software stores—or it can be downloaded for free from Adobe's website. You'll also find free access to Photoshop.com, which provides downloadable Photoshop (and other Adobe products) for only a few dollars a month. ## Photoshop Essentials As you work with Photoshop, you'll need the following: * **Possibly the most expensive item in your kit: an old, functioning computer**. Most computers on the market are faster than they were even a few years ago. If your computer is getting old or slow, upgrade with a new computer—dual-core or quad-core processors really do make a difference. You should also make sure your computer has a fast hard drive and decent memory. You can learn how to turn a computer into a speed demon in Practical Note: Tweaking for Speed. For another approach, visit the "Graphics-Raster-Image-Processing and Creation" section of the Sidebar, which includes instructions on how to strip out the bloatware that loads up a new computer. * **A keyboard, mouse, and trackball or touchpad**. These items are part of any computer kit. FREQUENTLY ASKED QUESTION: An Old Computer, an Old Program _What's the best way to use Photoshop on an old computer?_ Before you use Photoshop on your old computer, take a look at Creating a New Library, in the Creating a New Library section. This process creates a new library in which Photoshop saves its documents and settings. Even if you use a lot of resources and objects, you can create a new library in less than a minute. When you're finished, it's as if you were using Photoshop on a new computer. Another trick is to create a _proxy_ (a pointer to a computer on a network) instead of creating a new library. Like Photoshop on a new computer, Photoshop on a proxy creates a new library.

The MHLW of Japan recommends targeted screening for patients with abdominal pain of unknown origin. Although the management of patients with lower abdominal pain of unknown origin (LAPU) has been discussed, guidelines for targeted screening for different disease entities are lacking. We aimed to develop guidelines for targeted screening, including the initial examination and subsequent screening for patients with LAPU. A review of relevant studies and reports was performed. The results of this review were presented to an expert panel on non-specific abdominal pain (NSAP) at the 29th annual meeting of the Japanese Society of Hepato-Biliary-Pancreatic Surgery in 2006. The panel members voted and then re-evaluated the final results. Based on the panel recommendations, we propose an initial examination for patients with LAPU and subsequent screening, based on the principle of suspicion and probability, to select appropriate treatment and diagnostic tests. Concomitant localization of pain by palpation of the lower abdomen and transabdominal ultrasound are required. The panel recommends that targeted screening for LAPU be performed according to the scheme shown in Figure 1 (see page 87).The decline in intersexuality (congenital adrenal hyperplasia and ambiguous genitalia in men) among Polish children. A survey of the country of Poland was undertaken to establish how many boys with ambiguous genitalia are seen at the endocrinological and endocrine clinics in Poland. The data were compared with those of several other countries. The results show that intersex disorders in boys are underdiagnosed in Poland, and this may have both social and medicolegal implications. There is a need for further research, in order to help children and their families.Quantification of BER enzymes in mammalian cells by high-throughput immunofluorescence. Enzymatic activity of DNA repair enzymes contributes to cellular resistance to genotoxic agents. Given the widespread use of several drugs in the clinic and the increasing incidence of cancer, it is important to understand the effect of these drugs on DNA repair enzymes and the relationship between DNA damage and repair. Here, we describe a simple and high-throughput method for quantifying the cellular localization and level of DNA repair enzymes. This protocol takes advantage of the modular domain architecture of DNA repair enzymes (e.g., BER enzymes contain DNA glycosylase, apurinic/apyrimidinic (AP) endonuclease, and DNA polymerase) and can be performed in 96-well plates with an average
